Extracting the Pion scalar Form Factor ($q^2 \neq 0$)

The Pion scalar Radius

Summary and Outlook

Introduction - The scalar Form Factor of the Pion

- ▶ describes the coupling of a charged pion to a scalar particle
- ▶ related to the low energy constant l_4
- ▶ $F_s(Q^2) \equiv \langle \pi^+(p') | m_d \bar{d}d + m_u \bar{u}u | \pi^+(p) \rangle$

- ▶ disconnected loop $\sum_x \text{Tr} (\mathbf{D}^{-1}(x, x))$ requires all-to-all propagator
- ▶ method of stochastic sources very noisy
- ▶ stochastic estimate can be improved using a generalised hopping parameter expansion

Outline

Introduction

Generalised Hopping Parameter Expansion

Extracting the Pion scalar Form Factor ($q^2 = 0$)

Extracting the Pion scalar Form Factor ($q^2 \neq 0$)

The Pion scalar Radius

Summary and Outlook

The $\mathcal{O}(\mathbf{a})$ -improved Wilson-Dirac Operator

- ▶ $\mathcal{O}(\mathbf{a})$ -improved Wilson-Dirac operator

$$\mathbf{D}_{\text{sw}} = \frac{1}{2\kappa} \mathbb{1} + c_{\text{sw}} \mathbf{B} - \frac{1}{2} \mathbf{H}$$

- ▶ rewrite as

$$\mathbf{D}_{\text{sw}} = \mathbf{A} - \frac{1}{2} \mathbf{H} = \mathbf{A} \left(\mathbb{1} - \frac{1}{2} \mathbf{A}^{-1} \mathbf{H} \right) \quad \text{with} \quad \mathbf{A} = \frac{1}{2\kappa} \mathbb{1} + c_{\text{sw}} \mathbf{B}$$

The generalised Hopping Parameter Expansion

- ▶ geometric series

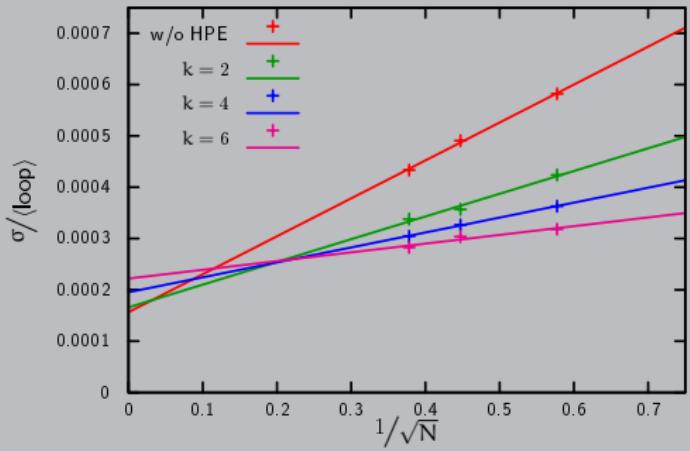

$$\mathbf{D}_{\text{sw}}^{-1} = \sum_{i=0}^{k-1} \left(\frac{1}{2} \mathbf{A}^{-1} \mathbf{H} \right)^i \mathbf{A}^{-1} + \left(\frac{1}{2} \mathbf{A}^{-1} \mathbf{H} \right)^k \mathbf{D}_{\text{sw}}^{-1}$$

- ▶ $\mathbf{D}_{\text{sw}}^{-1}$ on the right hand side estimated using stochastic sources
- ▶ cf. [Bali et al. arXiv:0910.3970]

The generalised Hopping Parameter Expansion

$$\mathbf{D}_{\text{sw}}^{-1} = \sum_{i=0}^{k-1} \left(\frac{1}{2} \mathbf{A}^{-1} \mathbf{H} \right)^i \mathbf{A}^{-1} + \left(\frac{1}{2} \mathbf{A}^{-1} \mathbf{H} \right)^k \mathbf{D}_{\text{sw}}^{-1}$$

- ▶ $\langle \text{loop} \rangle = \left\langle \sum_{\vec{x}} \text{Tr} (\mathbf{D}^{-1}(\mathbf{x}, \mathbf{x})) \right\rangle_{\mathbf{G}}$
- ▶ $\mathbf{D}_{\text{sw}}^{-1}$ on the right calculated with $N = 3, 5, 7$ stochastic sources
- ▶ Standard deviation without HPE and with $k = 2, 4, 6$ terms of HPE

Outline

Introduction

Generalised Hopping Parameter Expansion

Extracting the Pion scalar Form Factor ($\mathbf{q}^2 = 0$)

Extracting the Pion scalar Form Factor ($\mathbf{q}^2 \neq 0$)

The Pion scalar Radius

Summary and Outlook

Building Ratios ($q^2 = 0$)

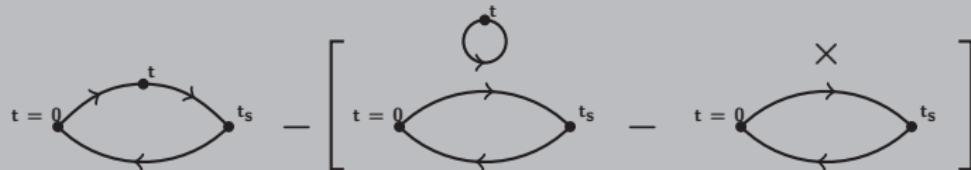

- ▶ 2pt-function:

$$C_{2\text{pt}} \sim |\langle 1|\phi(0)|0\rangle|^2 \left[e^{-m_\pi t_s} + e^{-m_\pi(T-t_s)} \right]$$

- ▶ 3pt-function with subtracted vacuum ($0 < t < t_s$)

$$C_{3\text{pt}} \sim |\langle 1|\phi(0)|0\rangle|^2 e^{-m_\pi t_s} \langle \pi | \mathcal{O}(0) | \pi \rangle$$

- ▶ Ratio of 3pt- and 2pt- function

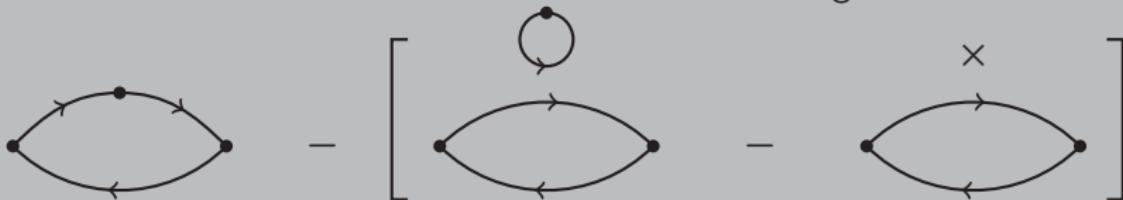

$$R = \frac{C_{3\text{pt}}}{C_{2\text{pt}}} \sim \langle \pi | \mathcal{O}(0) | \pi \rangle \frac{e^{-m_\pi t_s}}{e^{-m_\pi t_s} + e^{-m_\pi(T-t_s)}}$$

A few words on Renormalization

- ▶ chiral symmetry explicitly broken by Wilson fermions
- ▶ multiplicative and additive renormalization for the scalar operator

$$\langle \mathcal{O}^R \rangle = Z_s \langle \mathcal{O} - b_0 \rangle$$

- ▶ additive renormalization is cancelled when subtracting the vacuum

- ▶ for all form factor data shown in this talk the multiplicative renormalization is not taken into account
- ▶ the scalar radius is renormalization independent

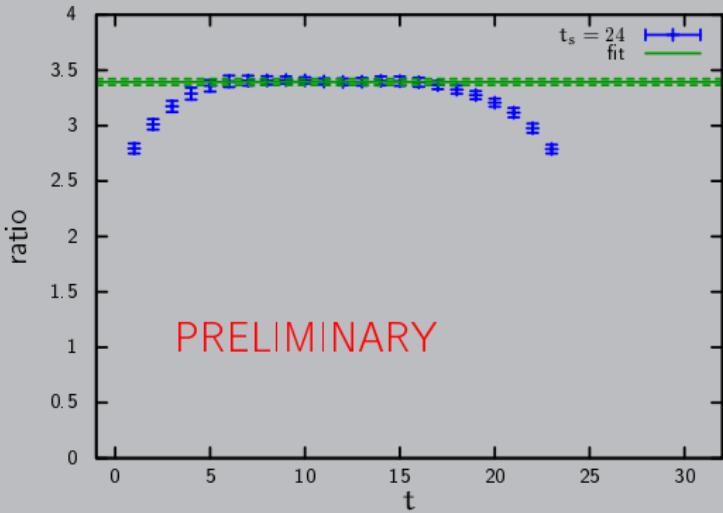

Connected part: Ratio

- ▶ CLS ensembles: $\mathcal{O}(a)$ -improved Wilson-Dirac operator and Wilson glue
 $N_f = 2$
- ▶ E4 lattice: 64×32^3 lattice, $m_\pi = 554$ MeV, $a = 0.0689$ fm,
162 configurations

Connected part: Ratio

- ▶ CLS ensembles: $\mathcal{O}(a)$ -improved Wilson-Dirac operator and Wilson glue
 $N_f = 2$
- ▶ E4 lattice: 64×32^3 lattice, $m_\pi = 554$ MeV, $a = 0.0689$ fm,
162 configurations

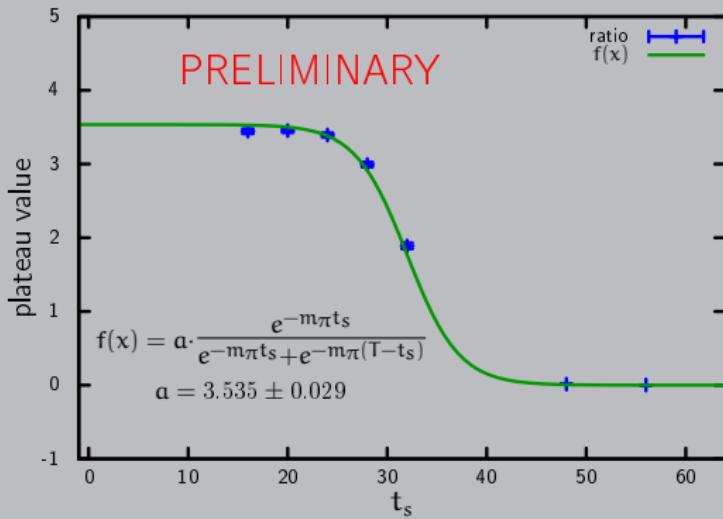

- ▶ ratios for fixed $t_s = 24$ as an example
- ▶ data show a plateau
- ▶ constant fit to the plateau region

Connected part: Ratio vs t_s

$$R \sim \langle \pi | \mathcal{O}(0) | \pi \rangle \frac{e^{-m_\pi t_s}}{e^{-m_\pi t_s} + e^{-m_\pi(T-t_s)}}$$

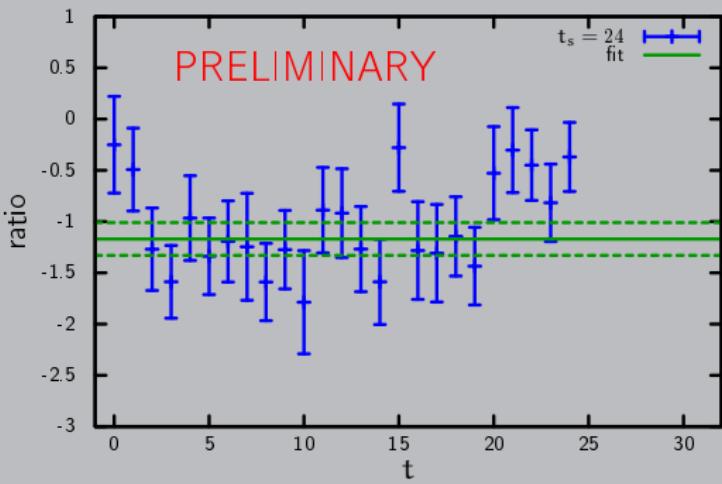

- ▶ plateau values for different t_s plotted against t_s
- ▶ data show the expected behaviour

$$\langle \pi | \mathcal{O} | \pi \rangle_{\text{con}}^{\text{bare}} (q^2 = 0) = 3.535 \pm 0.029$$

Disconnected part: Ratio

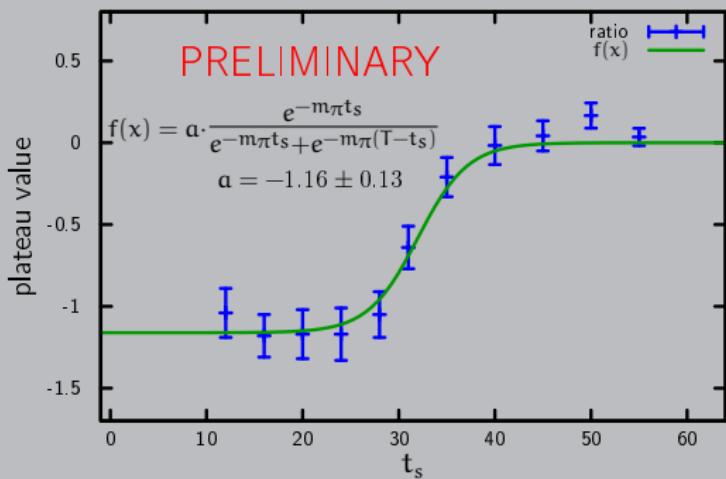

- ▶ statistic increased using 4 source positions for the 2pt-function
- ▶ ratios for fixed $t_s = 24$ as an example
- ▶ a plateau is obtained
- ▶ constant fit to the plateau region

Disconnected part: Ratio vs t_s

$$R \sim \langle \pi | \mathcal{O}(0) | \pi \rangle \frac{e^{-m_\pi t_s}}{e^{-m_\pi t_s} + e^{-m_\pi(T-t_s)}}$$

- ▶ plateau values for different t_s plotted against t_s
- ▶ data show the expected behaviour
- ▶ disconnected part of the scalar form factor $\approx 9\sigma$ away from zero

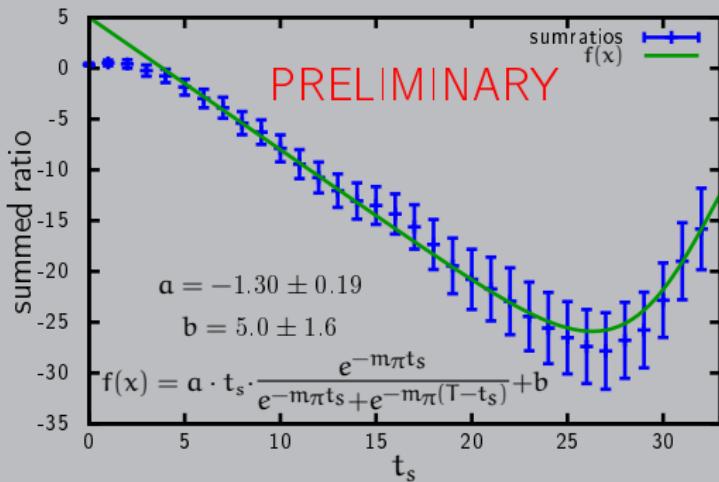

$$\langle \pi | \mathcal{O} | \pi \rangle_{\text{disc}}^{\text{bare}}(q^2 = 0) = 1.16 \pm 0.13$$

Disconnected part: Summation method

summed operator insertion (cf. [Maiani et al. 1987]):

$$\sum_{t=0}^{t_s} R \sim b + t_s \cdot \frac{e^{-m_\pi t_s}}{e^{-m_\pi t_s} + e^{-m_\pi(T-t_s)}} \langle \pi | \mathcal{O} | \pi \rangle$$

- ▶ data for summed operator insertions plotted against t_s
- ▶ expected behaviour
- ▶ value for the form factor compatible with value from plateau method
- ▶ statistical error slightly larger than error from plateau method

$$\langle \pi | \mathcal{O} | \pi \rangle_{\text{disc}}^{\text{bare}}(q^2 = 0) = 1.30 \pm 0.19$$

Outline

Introduction

Generalised Hopping Parameter Expansion

Extracting the Pion scalar Form Factor ($q^2 = 0$)

Extracting the Pion scalar Form Factor ($q^2 \neq 0$)

The Pion scalar Radius

Summary and Outlook

Building Ratios ($q^2 \neq 0$)

- ▶ 2pt-function:

$$C_{2\text{pt}}(p, t_s) \sim Z_p^2 \left[e^{-E_\pi t_s} + e^{-E_\pi(T-t_s)} \right]$$

- ▶ 3pt-function:

$$C_{3\text{pt}}(p, p', t, t_s) \sim Z_p Z_{p'} \langle \pi(p) | \mathcal{O}(q^2) | \pi(p') \rangle e^{-E_\pi(t_s - t)} e^{-E'_\pi t}$$

with $q^2 = (p - p')^2$

- ▶ Ratio

$$R = \frac{C_3(p, p', t, t_s)}{C_2(p, t_s)} \cdot \sqrt{\frac{C_2(p, t_s) C_2(p, t) C_2(p', (t_s - t))}{C_2(p', t_s) C_2(p', t) C_2(p, (t_s - t))}}$$

$$R \rightarrow \langle \pi(p) | \mathcal{O}(q^2) | \pi(p') \rangle \quad \text{for } 0 \ll t \ll t_s \ll T/2$$

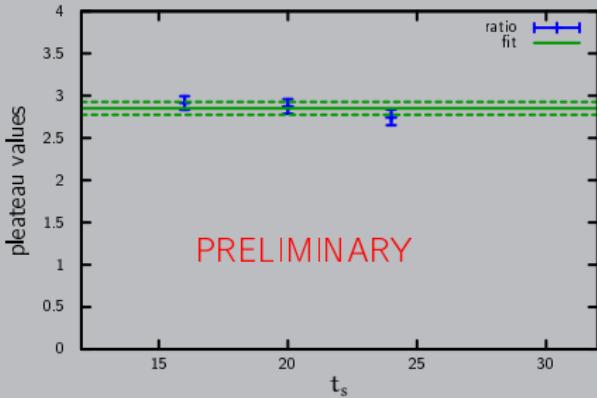

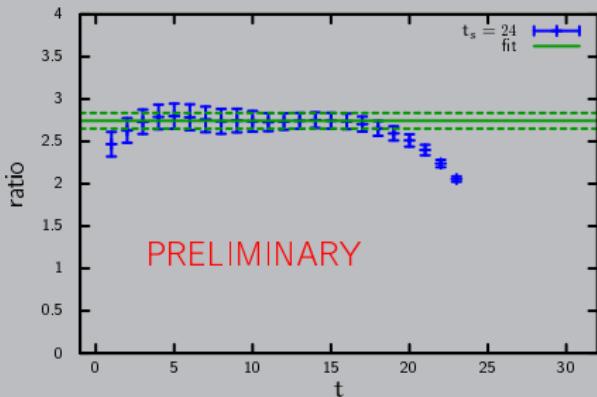

Connected part: Ratio

- ▶ momentum insertion via Fourier transformation
- ▶ momentum insertion at the operator:

$$\vec{q} = (0, 0, 1) \frac{2\pi}{L \cdot a}$$

- ▶ momentum transfer:
- $$Q^2 = -q^2 = 0.259 \text{ GeV}^2$$
- ▶ constant fit to three different plateau values:

$$\langle \pi | \mathcal{O} | \pi \rangle_{\text{con}}^{\text{bare}} = 2.851 \pm 0.076$$

Disconnected part: Ratio

- ▶ momentum insertion via Fourier transformation
- ▶ momentum insertion at the operator:

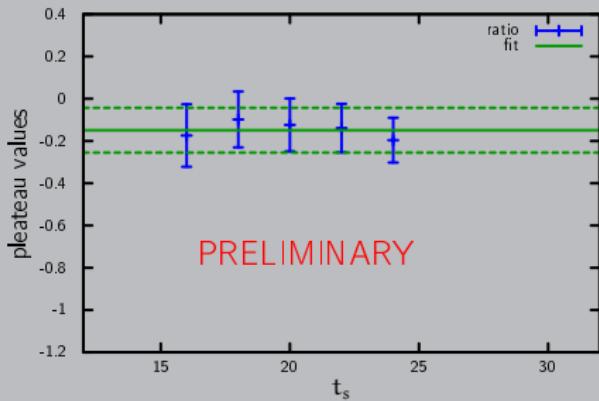

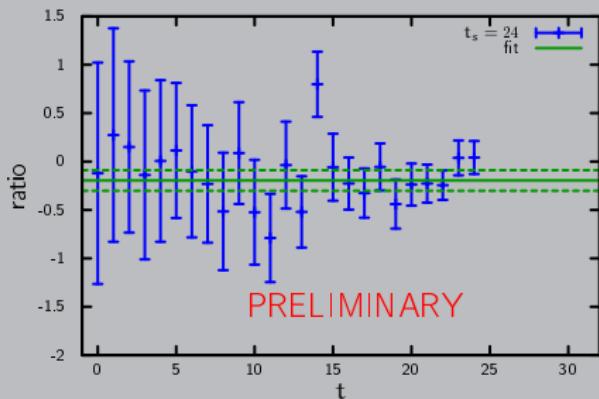

$$\vec{q} = (0, 0, 1) \frac{2\pi}{L \cdot a}$$

- ▶ momentum transfer:

$$Q^2 = -q^2 = 0.259 \text{ GeV}^2$$

- ▶ constant fit to three different plateau values:

$$\langle \pi | \mathcal{O} | \pi \rangle_{\text{disc}}^{\text{bare}} = 0.149 \pm 0.106$$

Outline

Introduction

Generalised Hopping Parameter Expansion

Extracting the Pion scalar Form Factor ($\mathbf{q}^2 = 0$)

Extracting the Pion scalar Form Factor ($\mathbf{q}^2 \neq 0$)

The Pion scalar Radius

Summary and Outlook

The Q^2 dependence - connected form factor

$$F_s(Q^2) = F_s(0) \left(1 - \frac{1}{6} \langle r^2 \rangle_s Q^2 + \mathcal{O}(Q^4) \right)$$

The Q^2 dependence - connected form factor

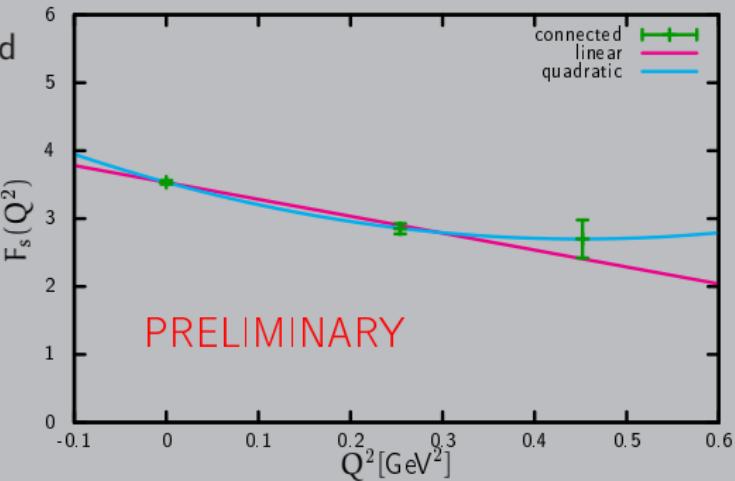

$$F_s(Q^2) = F_s(0) \left(1 - \frac{1}{6} \langle r^2 \rangle_s Q^2 + \mathcal{O}(Q^4) \right)$$

- ▶ considering only the connected part
- ▶ fitting a linear curve to the three data points:

$$\langle r^2 \rangle_s = 0.164 \pm 0.020 \text{ fm}^2$$

- ▶ quadratic:

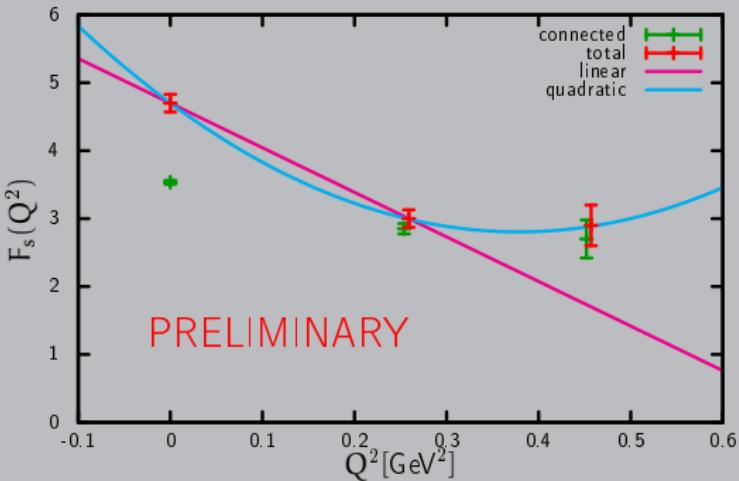

$$\langle r^2 \rangle_s = 0.244 \pm 0.056 \text{ fm}^2$$

The Q^2 dependence

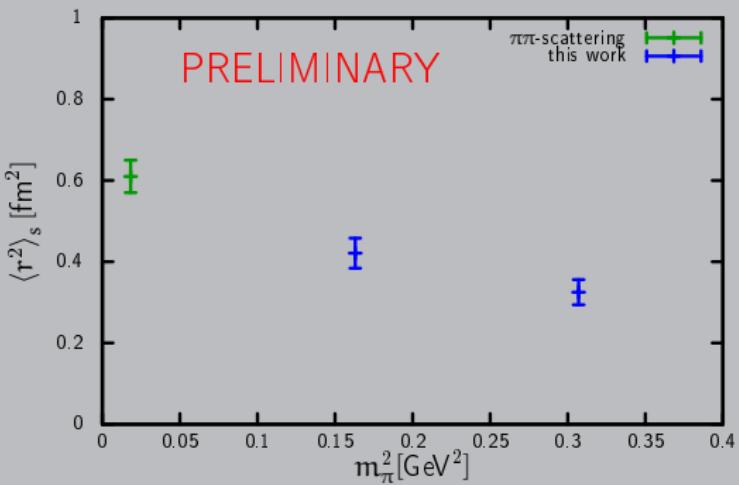

$$F_s(Q^2) = F_s(0) \left(1 - \frac{1}{6} \langle r^2 \rangle_s Q^2 + \mathcal{O}(Q^4) \right)$$

- ▶ disconnected contribution to the scalar radius of same magnitude
cf. [talk by A. Jüttner]
- ▶ linear:
 $\langle r^2 \rangle_s = 0.325 \pm 0.031 \text{ fm}^2$
- ▶ quadratic:
 $\langle r^2 \rangle_s = 0.494 \pm 0.068 \text{ fm}^2$

The scalar Radius - m_π^2 dependence

- ▶ two different ensembles
- ▶ point at physical pion mass from $\pi\pi$ -scattering data
[Colangelo et al.
[arXiv:hep-ph/0103088](https://arxiv.org/abs/hep-ph/0103088)]

Outline

Introduction

Generalised Hopping Parameter Expansion

Extracting the Pion scalar Form Factor ($\mathbf{q}^2 = 0$)

Extracting the Pion scalar Form Factor ($\mathbf{q}^2 \neq 0$)

The Pion scalar Radius

Summary and Outlook

Summary

- ▶ calculation of scalar form factor works with Wilson fermions
- ▶ disconnected contribution can be calculated precisely using the generalised hopping parameter expansion
- ▶ contribution of the disconnected part to the scalar radius is of same order as the connected

Outlook

- ▶ more ensembles
- ▶ calculate the connected part using partially twisted boundary conditions
- ▶ chiral extrapolation for the scalar radius
- ▶ study systematic errors
- ▶ calculation of other quantities including disconnected contributions
