

Universal physics of three bosons with isospin

Tetsuo Hyodo

Yukawa Institute for Theoretical Physics, Kyoto Univ.

2014, Apr. 10th 1

Contents

- Introduction: universal few-body physics
- Tuning pion interaction
- Three pions with large scattering length
- Realization and consequences

T. Hyodo, T. Hatsuda, Y. Nishida, Phys. Rev. C89, 032201(R) (2014)

Universal physics

Universal: different systems share the identical feature

Critical phenomena around phase transition

- large correlation length ξ
- scaling, critical exponent, ...
- liquid-gas transition \sim ferromagnet

N. Goldenfeld, “*Lectures on phase transitions and the renormalization group*” (1992)

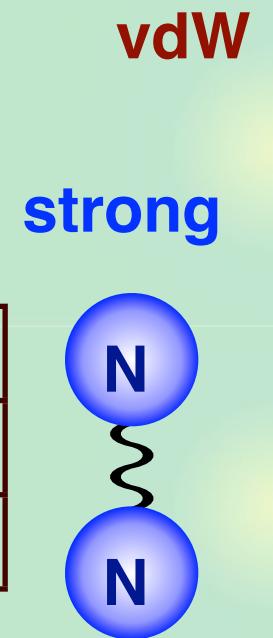

Universal physics in **few-body** system

- large two-body scattering length $|a|$
- scaling, shallow bound state

$$a \rightarrow \lambda a, \quad E \rightarrow \lambda^{-2} E$$

$$B_2 = \frac{1}{ma^2}$$

	N [MeV]	${}^4\text{He}$ [mK]
B_2	2.22	1.31
$1/ma^2$	1.41	1.12

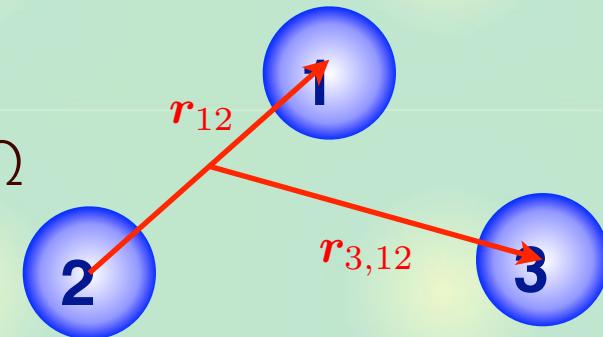

Three-body system: scaling and its violation

Three-body system in hyperspherical coordinates

$$(r_{12}, r_{3,12}) \leftrightarrow \underline{(R, \alpha_3, \hat{r}_{12}, \hat{r}_{3,12})}$$

hyperradius **hyperangular variables** Ω
 (dimensionless)

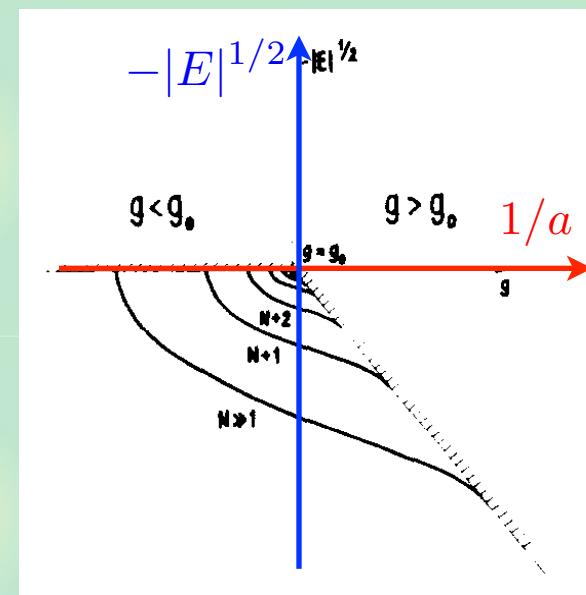

For $|a| \rightarrow \infty$, system is scale invariant.

$$V(R, \Omega) \propto \frac{1}{R^2}$$

Efimov effect : **attractive** $1/R^2$ for identical
three bosons

V. Efimov, Phys. Lett. B 33, 563-564 (1970)

- infinitely many bound states
- discrete scale invariance --> limit cycle

P.F. Bedaque, H.-W. Hammer, U. van Kolck, Phys. Rev. Lett. 82, 463-437 (1999)

Pion interaction

$\pi\pi$ scattering length \leftarrow chiral low energy theorem

S. Weinberg, Phys. Rev. Lett. 17, 616-621 (1966)

$$a^{I=0} \propto -\frac{7}{4} \frac{m_\pi}{f_\pi^2}, \quad a^{I=2} \propto \frac{1}{2} \frac{m_\pi}{f_\pi^2}$$

- $1/f_\pi^2 \sim$ spontaneous breaking of chiral symmetry
- $m_\pi \sim$ explicit breaking of chiral symmetry

In nature, the scattering lengths are small $\leftarrow m_\pi$ is small

- $a^{l=0} \sim -0.31$ fm, $a^{l=2} \sim 0.06$ fm / QCD scale ~ 1 fm

If we can adjust m_π or f_π , $|a|$ may be increased by $m_\pi \nearrow$ or $f_\pi \searrow$

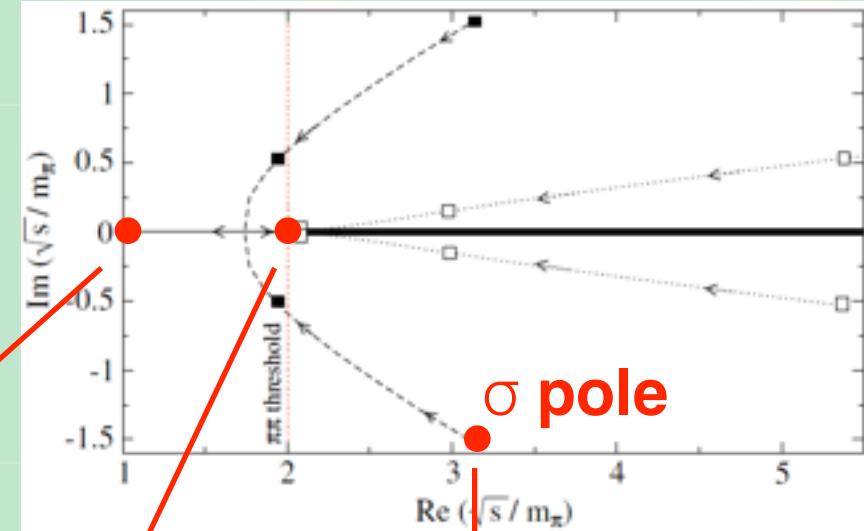

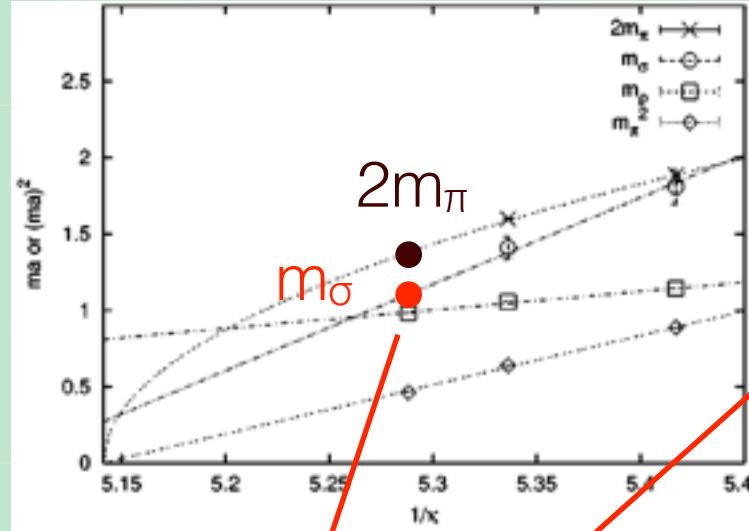

- sufficient attraction
--> bound state in $|l|=0$
--> diverging $|a|$

- sigma: $|l|=0$ resonance

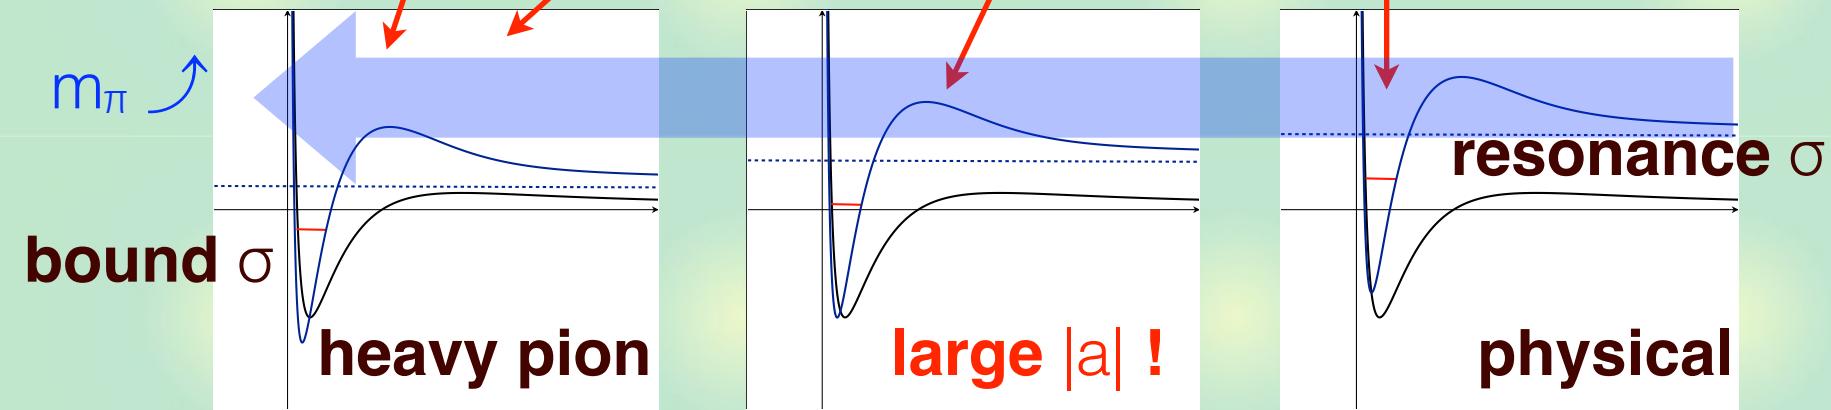

$f_0(500)$ or σ was $f_0(600)$	$I^G(J^{PC}) = 0^+(0^{++})$

Increase pion mass

Lattice QCD/chiral EFT can tune the pion mass

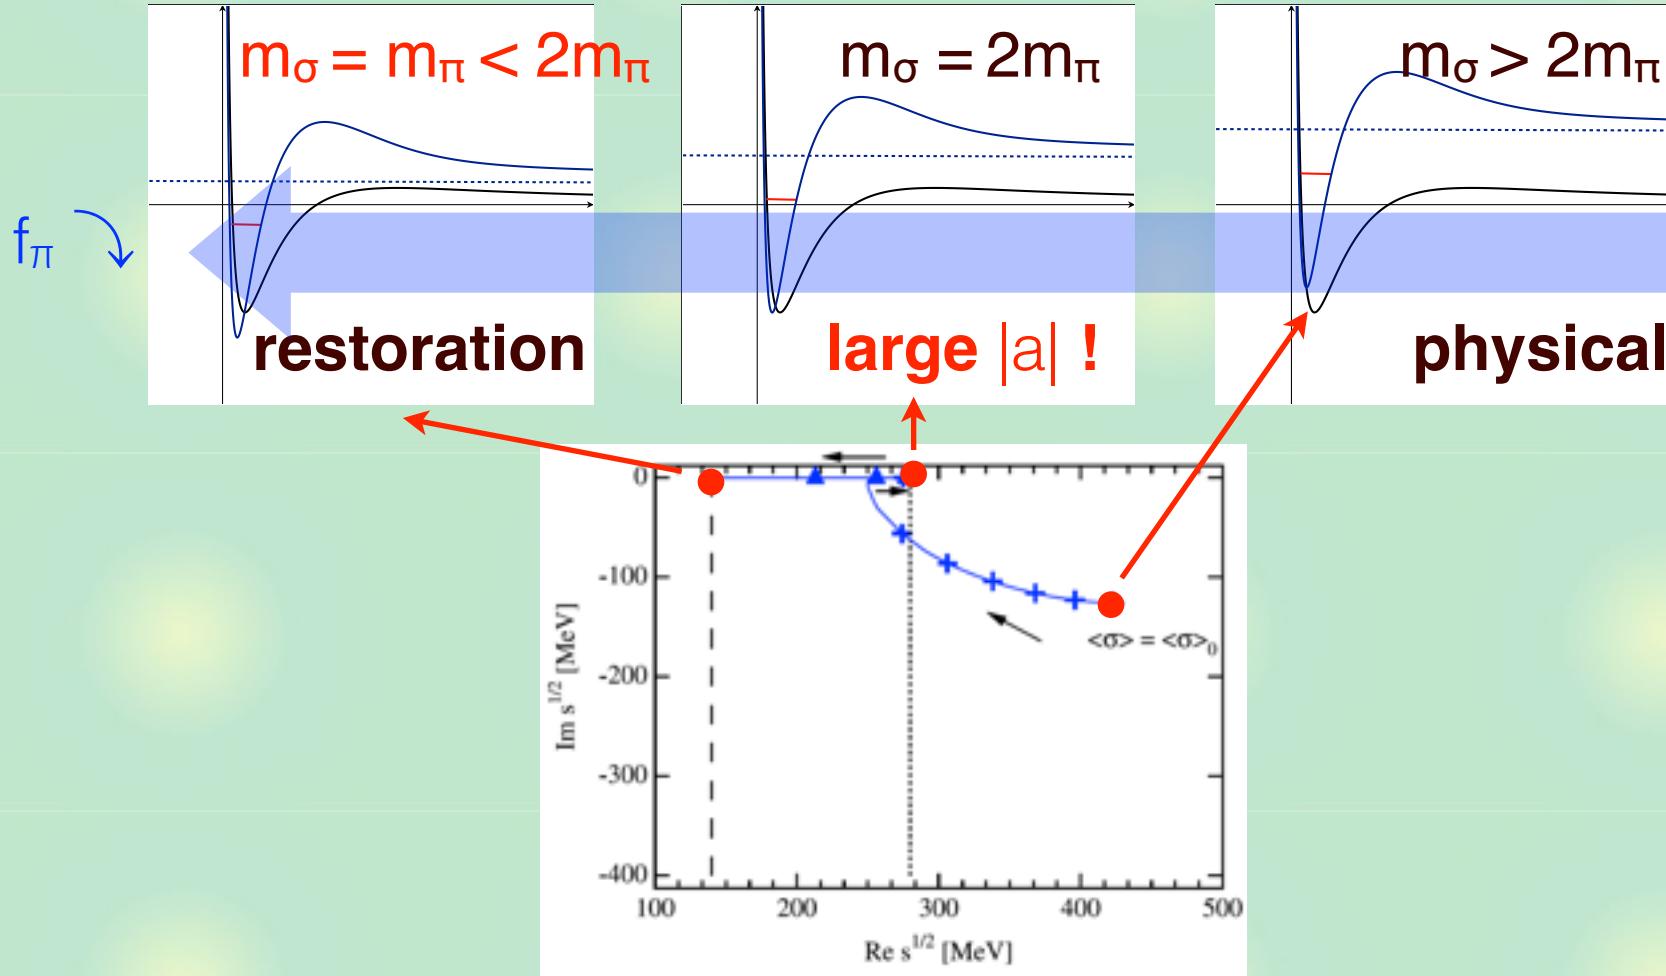

T. Kunihiro *et al* (SCALAR Collaboration), Rev. Rev. D70, 034504 (2004)
 C. Hanhart, J.R. Pelaez, G. Rios, Phys. Rev. Lett. 100, 152001 (2008)

==> Numerical experiment (lattice QCD)!

Decrease pion decay constant

Chiral symmetry restoration \sim reduction of f_π

T. Hyodo, D. Jido, T. Kunihiro, Nucl. Phys. A848, 341-365 (2010)

==> Real experiment (in-medium symmetry restoration) !

Three pions with large scattering length

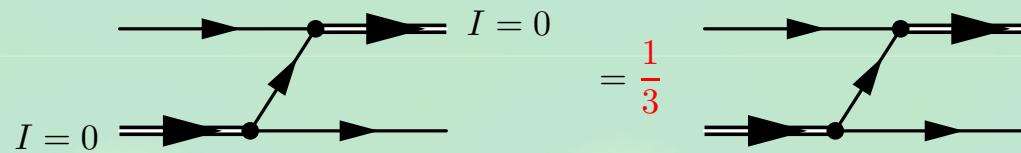

Three pions with isospin symmetry

Large $|l=0$ scattering length

$$f_{I=0} = \frac{1}{-1/a - ip}, \quad f_{I=2} = 0$$

S-wave three-pion system in total $|l=1$

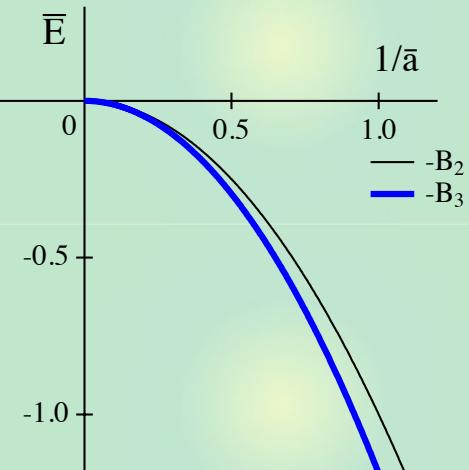

$$\begin{pmatrix} |\pi \otimes [\pi \otimes \pi]_{I=0} \rangle_{I=1} \\ |\pi \otimes [\pi \otimes \pi]_{I=2} \rangle_{I=1} \end{pmatrix} = \begin{pmatrix} 1/3 & \sqrt{5}/3 \\ \sqrt{5}/3 & 1/6 \end{pmatrix} \begin{pmatrix} |[\pi \otimes \pi]_{I=0} \otimes \pi \rangle_{I=1} \\ |[\pi \otimes \pi]_{I=2} \otimes \pi \rangle_{I=1} \end{pmatrix}$$

Eigenvalue equation for 3-body system

$$z(|\mathbf{p}|) = \frac{2}{3\pi} \int_0^\infty d|\mathbf{q}| \frac{|\mathbf{q}|}{|\mathbf{p}|} \ln \left(\frac{\mathbf{q}^2 + \mathbf{p}^2 + |\mathbf{q}||\mathbf{p}| + mB_3}{\mathbf{q}^2 + \mathbf{p}^2 - |\mathbf{q}||\mathbf{p}| + mB_3} \right)^{1.0} \times \frac{z(|\mathbf{q}|)}{\sqrt{\frac{3}{4}\mathbf{q}^2 + mB_3} - \frac{1}{a}}$$

$$B_3 = \frac{1.04391}{ma^2} \quad \text{for } 1/a > 0 \quad \text{c.f.} \quad B_2 = \frac{1}{ma^2}$$

Three pions with isospin breaking

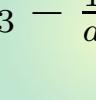

Isospin breaking: $m_{\pi^\pm} = m_{\pi^0} + \Delta$ with $\Delta > 0$

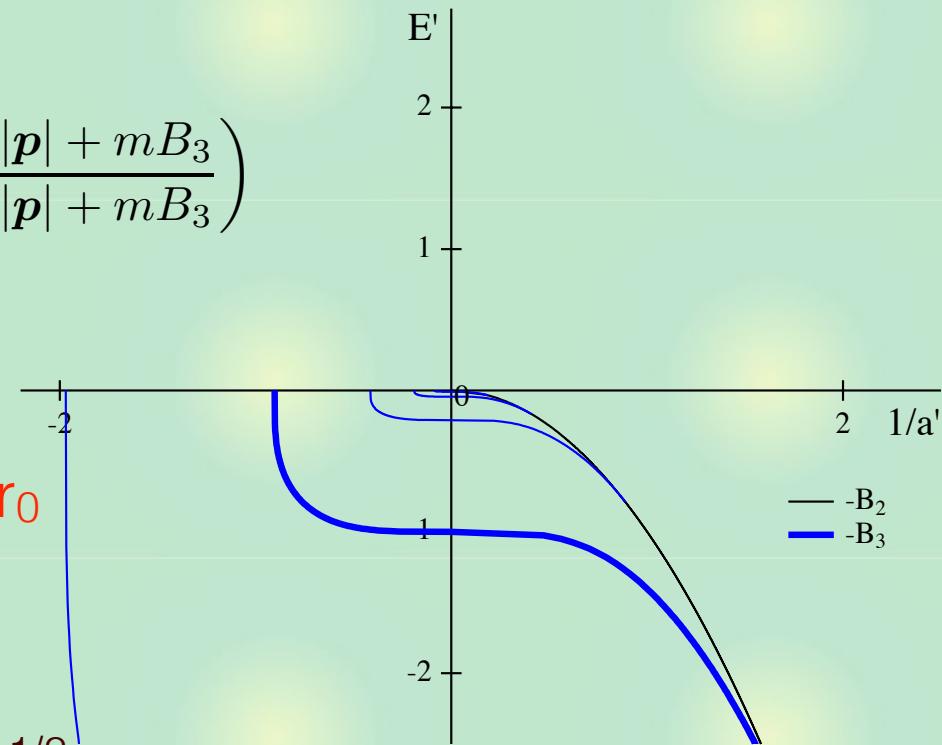

- In the energy region $E \ll \Delta$, heavy π^\pm can be neglected.

Identical three-boson system with a large scattering length
--> Efimov effect

$$z(|\mathbf{p}|) = \frac{2}{\pi} \int_0^\infty d|\mathbf{q}| \frac{|\mathbf{q}|}{|\mathbf{p}|} \ln \left(\frac{\mathbf{q}^2 + \mathbf{p}^2 + |\mathbf{q}||\mathbf{p}| + mB_3}{\mathbf{q}^2 + \mathbf{p}^2 - |\mathbf{q}||\mathbf{p}| + mB_3} \right)$$

$$\times \frac{z(|\mathbf{q}|)}{\sqrt{\frac{3}{4}\mathbf{q}^2 + mB_3} - \frac{1}{a}} f_\Lambda(|\mathbf{q}|)$$

cutoff $\sim 1/r_0$

Universal physics at $E \ll (2m\Lambda)^{1/2}$

<- Efimov parameter K^*

Coupled-channel effect

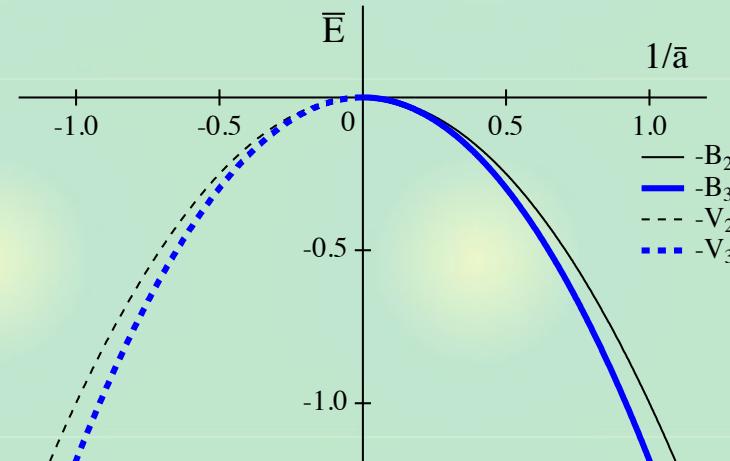

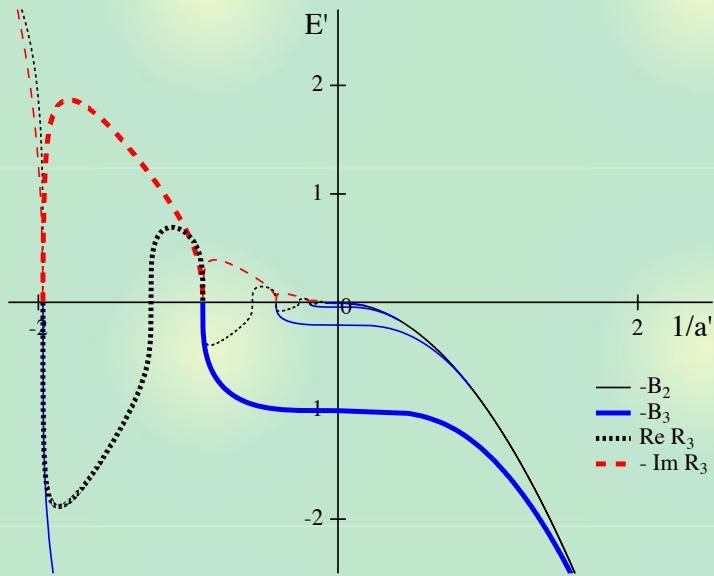

Two universal phenomena : existence of the coupled channel

$$z(|\mathbf{p}|) = \frac{2}{\lambda\pi} \int_0^\infty d|\mathbf{q}| \frac{|\mathbf{q}|}{|\mathbf{p}|} \ln\left(\frac{\mathbf{q}^2 + \mathbf{p}^2 + |\mathbf{q}||\mathbf{p}| + mB_3}{\mathbf{q}^2 + \mathbf{p}^2 - |\mathbf{q}||\mathbf{p}| + mB_3}\right) \frac{z(|\mathbf{q}|)}{\sqrt{\frac{3}{4}\mathbf{q}^2 + mB_3} - \frac{1}{a}}$$

$$\lambda < 2.41480$$

$$2.41480 < \lambda < 3.66811$$

$$3.66811 < \lambda$$

no universal bound state

Both cases can be realized in three-pion systems.

Implication in hadron physics

Numerical experiment by lattice QCD : $m_\pi \nearrow$

- Find the quark mass with which σ appears at threshold
- Calculate the energy of three-pion system
- Note: to confirm the Efimov effect, the simulation requires very high resolution.

In-medium restoration of chiral symmetry : $f_\pi \searrow$

- existence of shallow bound state(s) for $1/|a| \rightarrow 0$
- When the $\sigma(l=J=0)$ softens, $\pi^*(l=1, J=0)$ also softens simultaneously.
- Note: σ softening is difficult to confirm due to the final state interaction, mixing with quark number fluctuation, ...

Summary

Universal physics of three pions

- Large $\pi\pi$ scattering length ($|l|=0$) can be obtained by $m_\pi \nearrow$ or $f_\pi \searrow$.
- Universal phenomena with large a :
 - **single bound state (isospin symmetry)**
 - **Efimov states (isospin breaking)**
- Consequence in hadron physics:
 - realization in lattice QCD
 - simultaneous softening of σ and π^*
