*Let us try to discover the first(?) dibaryon (after deuteron) !
(First dibaryon with $S<0$!)*

Ω^- p potential from lattice QCD

- Lattice QCD predicts Ω^- p bound state at large quark mass, $m_\pi=875$ MeV (B.E.~ 19 MeV) in 5S_2 channel.

F.Etminan et al. (HAL QCD Collab.), NPA928('14)89.

- Extrapolation to physical quark mass
 - VI $\rightarrow$ Weaker potential (no b.s.)
 - VII $\rightarrow$ Same potential (shallow b.s.)
 - VIII $\rightarrow$ Stronger potential (deep b.s.)

Spin-2 $N\Omega$ Potentials		V_I	V_{II}	V_{III}
without Coulomb	E_B [MeV]	—	0.05	24.8
	a_0 [fm]	-1.0	23.1	1.60
	r_{eff} [fm]	1.15	0.95	0.65
with Coulomb	E_B [MeV]	—	6.3	26.9
	a_0 [fm]	-1.12	5.79	1.29
	r_{eff} [fm]	1.16	0.96	0.65

Ω - p correlation

(w/o Coulomb, Strong absorption at $r < 2$ fm in 3S_1 (decay to 8-8 in S-wave))

K. Morita, AO, F. Etminan, T. Hatsuda, PRC94('16)031901(R) [arXiv:1605.06765 [hep-ph]]

Ω - p correlation

(w/o Coulomb, Strong absorption at $r < 2$ fm in 3S_1 (decay to 8-8 in S-wave))

K. Morita, AO, F. Etminan, T. Hatsuda, PRC94('16)031901(R) [arXiv:1605.06765 [hep-ph]]

Ω - p correlation w/ Coulomb

With Coulomb

Coulomb + Gamow corr.

Coulomb potential washes out the features of V_I , V_{II} , V_{III} , and Gamow correction is not enough.

Ω - p correlation: Small / Large Ratio

Ω - p correlation: Small / Large Ratio

By taking small ($R=2.5\text{ fm}$) / large ($R=5\text{ fm}$) ratio, we approximately see the corr. fn. w/o Coulomb !

K^-p correlation

$K^- p$ interaction

How about $K^- p$ correlation ?

$K^- p$ scattering and $K^- p$ correlation

- $K^- p$ scattering: Plane wave + Outgoing spherical wave

$$\Psi^{(+)}(K^- p) \rightarrow \exp(ikz)\chi(K^- p) + \frac{\exp(ikr)}{r} \left[f(K^- p \rightarrow K^- p)\chi(K^- p) + f(K^- p \rightarrow \bar{K}^0 n)\chi(\bar{K}^0 n) \right]$$

K^- p scattering and K^- p correlation

■ K^- p scattering: Plane wave + Outgoing spherical wave

$$\Psi^{(+)}(K^- p) \rightarrow \exp(ikz)\chi(K^- p) + \frac{\exp(ikr)}{r} [f(K^- p \rightarrow K^- p)\chi(K^- p) + f(K^- p \rightarrow \bar{K}^0 n)\chi(\bar{K}^0 n)]$$

■ K^- p correlation: **Plane wave + Incoming spherical wave**

$$\Psi^{(-)}(K^- p) \rightarrow \exp(ikz)\chi(K^- p) + \frac{\exp(-ikr)}{r} [\tilde{f}(K^- p \rightarrow K^- p)\chi(K^- p) + \tilde{f}(K^- p \rightarrow \bar{K}^0 n)\chi(\bar{K}^0 n)]$$

$$\tilde{f}(K^- p \rightarrow K^- p) = \frac{\tilde{S}-1}{2iq} \neq f(K^- p \rightarrow K^- p) \quad , \quad \tilde{S} = \left[\frac{S_{I=0}^{-1} + S_{I=1}^{-1}}{2} \right]^{-1}$$

$K^- p$ scattering and $K^- p$ correlation

- $K^- p$ scattering: Plane wave + Outgoing spherical wave

$$\Psi^{(+)}(K^- p) \rightarrow \exp(ikz)\chi(K^- p) + \frac{\exp(ikr)}{r} [f(K^- p \rightarrow K^- p)\chi(K^- p) + f(K^- p \rightarrow \bar{K}^0 n)\chi(\bar{K}^0 n)]$$

- $K^- p$ correlation: **Plane wave + Incoming spherical wave**

$$\Psi^{(-)}(K^- p) \rightarrow \exp(ikz)\chi(K^- p) + \frac{\exp(-ikr)}{r} [\tilde{f}(K^- p \rightarrow K^- p)\chi(K^- p) + \tilde{f}(K^- p \rightarrow \bar{K}^0 n)\chi(\bar{K}^0 n)]$$

$$\tilde{f}(K^- p \rightarrow K^- p) = \frac{\tilde{S}-1}{2iq} \neq f(K^- p \rightarrow K^- p) \quad , \quad \tilde{S} = \left[\frac{S_{I=0}^{-1} + S_{I=1}^{-1}}{2} \right]^{-1}$$

$\Psi^{(-)} \neq (\Psi^{(+)})^ \rightarrow K^- p$ correlation probes different combination of $I=0, 1$ from $K^- p$ scattering*

K^-p correlation

AO, K.Morita, K.Miyahara, T.Hyodo, arXiv:1603.05761

Potential: K. Miyahara, T. Hyodo, PRC93 ('16) 015201.

Amplitude: Y. Ikeda, T. Hyodo, W. Weise, PLB 706 ('11) 63; NPA 881 ('12) 98.

Fitting SIDDHARTA data: M. Bazzi et al. [SIDDHARTA Collab.], PLB 704 ('11) 113.

K^-p correlation

$\psi^{(-)}$: Another source of fake peak ?

K. Miyahara

Summary

- Heavy-ion collisions are hadron factories, and can be utilized to perform hadron physics as well.
- Hadron-Hadron correlation contains information on interactions.
 - Correlations in various pairs have been measured: $\pi\pi$, KK , pp , nn , $\bar{p} \bar{p}$, $\Lambda\Lambda$, Λp , $(K^- p, \Omega^- p,)$...
 - When the pair purity is large enough, corr. fn. has sensitivity to hh interaction.
- Some of hh correlations have been discussed.
 - $\Lambda\Lambda$ correlation data is consistent with $\Lambda \Lambda$ interaction with $1/a_0 < -0.8 \text{ fm}^{-1}$, provided that pair purity is large enough, $\lambda > 0.35$.
 - $\Omega^- p$ correlation may tell us the existence of a $S=-3$ dibaryon.
 - $K^- p$ correlation is found to probe other combination of scattering amplitudes of $I=0$ and $I=1$.
- Many other type of pairs are waiting for us.

Thank you !

Hadron yields are well explained by the statistical model.

■ Coalescence of quarks

R.J.Fries, B. Muller, C. Nonaka, S.A.Bass, PRL90('03)202303;

V. Greco, C.M.Ko, P. Levai, PRL90('03)202302;

R.C.Hwa, C.B.Yang, PRC67('03)034902

pT spectra and v2 are explained by coalescence of quarks.

■ Coalescence of hadrons

H.Sato, K. Yazaki, PLB98('81)153

Deuteron spectrum is explained by the coalescence of pn.

Exotic Hadron Production in HIC

- How do exotic hadrons are produced ?
Statistical ?
Quark Coalescence ?
Hadron Coalescence ?
- Statistical model overestimates $\Lambda(1520, 3/2^-)$ yield.
L=2 effects: Kanada-En'yo, Muller ('06)
- Statistical model underestimates $f_0(980)$ yield
P. Fachini [STAR Collab.], NPA715('03)462.
STAR: $N(f_0(980)) \sim 8.4$, Stat: 5.6,
Coal: 2q:0.76-3.8, 4q:0.1, Mol: 13
S. Cho et al. [ExHIC Collab.], PRL106 ('11)212001.

Production yield in HIC may tell us the nature of exotic hadrons !

Exotic Hadron Production in HIC

S. Cho et al. [ExHIC Collab.], PRL106 ('11)212001; PRC84('11)064910.

Hadronic molecules will be made more abundantly in HIC than stat. model predictions.

Correlation $\rightarrow$ Interaction

- If we know correlation and source, it should be possible to get knowledge of hadron interactions !
- How about $\Lambda\Lambda$ interaction ?

- Λ particle is too short-lived to perform scattering experiments.
 Mass=1115.6 MeV, $\tau = 2.6 \times 10^{-10}$ s, $c\tau = 7.89$ cm
 quark content = uds (p=uud, n=udd)

AO, Y. Hirata, Y. Nara, S. Shinmura, Y. Akaishi C. Greiner, B. Muller, PLB219(1989)199.
 Nucl. Phys. A 670 (2000), 297c

Feed-Down Effects & Residual Source

■ Correlation Fn. w/ Feed-down & Residual source effects.

$$C_{\text{corr}}(q) = 1 + \lambda(C_{\text{bare}}(q) - 1) + a_{\text{res}} \exp(-4r_{\text{res}}^2 q^2)$$

■ Purity of $\Lambda\Lambda$ pair λ

- Not easy to reject Σ^0 decay in exp't.

$$\rightarrow \lambda \sim (1 - \Sigma^0/\Lambda)^2$$

- Morita, Furumoto, AO ('15)

$$\rightarrow \lambda = (0.67)^2 = 0.45$$

$$\Sigma^0/\Lambda = 0.278 \text{ (p+Be, 28.5 GeV/c)}$$

Sullivan et al. ('87)

$$\Xi/\Lambda = 15 \% \text{ (RHIC)}$$

- STAR ('15)

$$\rightarrow \lambda = \text{Free parameter} \sim 0.18$$

*$C(q \sim 0) \sim 0.8$ suggests
attraction with large λ ($\lambda > 0.35$)
repulsion with small λ ($\lambda < 0.35$)*

AO, Morita, Mihayara, Hyodo ('16)

Detecting H Resonance

When the resonance energy is much above the threshold, detecting a resonance is not easy because of huge background.

3S_1 contribution

- Ω ($J=3/2$) and p ($J=1/2$) can take spin quintet (5S_2) and triplet (3S_1) states for $L=0$.
 - 5S_2 ($J=2$) couples with octet-octet (e.g. $\Lambda\Xi$) via $L=2$.
 - 3S_1 ($J=1$) couples with octet-octet (e.g. $\Lambda\Xi$) via $L=0$.
→ strong absorption is expected at short distances.
- Our assumption: Strong absorption at $r < 2$ fm.
 - Strong absorption limit = Hard core boundary condition.
 - Intermediate absorption gives similar results.

$a_0(\Lambda\Lambda)$: Positive or Negative

free $\lambda \rightarrow$ positive a_0 is preferred by the STAR data.

fixed λ ($\lambda > 0.35$) $\rightarrow$ negative a_0 is preferred by the STAR data.
